Big Meadows Valley Groundwater Basin

- Groundwater Basin Number: 8-7
- County: San Bernardino
- Surface Area: 14,200 acres (22.2 square miles)

Basin Boundaries and Hydrology
This basin underlies a mountain valley in the upper reach of the Santa Ana River. The basin is bounded on the west by Seven Oaks Valley Groundwater Basin along the Slide Peak fault (Rogers 1967) and elsewhere by impermeable crystalline rocks of the San Bernardino Mountains. The valley is drained by the Santa Ana River and receives an average annual precipitation ranging from 24 to 36 inches.

Hydrogeologic Information

Water Bearing Formations
Groundwater in the basin is found in alluvium that typically consists of clay, silt, sand, and gravel. Alluvial material appears to reach about 400 feet in thickness in some parts of the basin.

Restrictive Structures
The Slide Peak, Santa Ana, and San Gorgonio faults are mapped as cutting through basin materials (Rogers 1967); however, it is not known whether or not these faults impede groundwater movement.

Recharge Areas
Recharge is probably derived principally from percolation of precipitation and stream flow in the Santa Ana River.

Groundwater Level Trends
Average water level for wells drilled in the 1990s was about 25 feet below ground surface.

Groundwater Storage
Groundwater Storage Capacity. The total storage capacity is estimated at 10,000 af (DWR 1975).

Groundwater in Storage. No information is available.

Groundwater Budget (Type C)
No information is available.

Groundwater Quality
Characterization. Water sampled from 4 public supply wells show an average TDS content of approximately 152 mg/L with a range of 119 to 218 mg/L.

Impairments. No information is available.

1 A description of each member in the constituent groups and a generalized discussion of the relevance of these groups are included in California’s Groundwater – Bulletin 118 by DWR (2003).

2 Represents distinct number of wells sampled as required under DHS Title 22 program from 1994 through 2000.

3 Each well reported with a concentration above an MCL was confirmed with a second detection above an MCL. This information is intended as an indicator of the types of activities that cause contamination in a given basin. It represents the water quality at the sample location. It does not indicate the water quality delivered to the consumer. More detailed drinking water quality information can be obtained from the local water purveyor and its annual Consumer Confidence Report.
