Hemet Lake Valley Groundwater Basin

- Groundwater Basin Number: 8-06
- County: Riverside
- Surface Area: 16,700 acres (26.1 square miles)

Basin Boundaries and Hydrology
The Hemet Lake Valley Groundwater Basin underlies Gardner Valley in the southwestern San Jacinto Mountains. The basin is bounded on the southeast by the Vandeventer Flat Groundwater Basin and otherwise bounded by impermeable rocks of the San Jacinto Mountains. The valley is drained by the South Fork of the San Jacinto River and receives an average annual precipitation ranging from about 14 to 28 inches.

Hydrogeologic Information

Water Bearing Formations
Groundwater in the basin is found in Quaternary age younger and older alluvium that consists of clay, silt, sand, and gravel. Alluvial deposits may reach as about 100 feet in thickness, but are more commonly less than about 45 feet thick. Groundwater is also produced from residuum and from fractured crystalline rocks below the basin.

Restrictive Structures
The Hot Springs fault is mapped in the northern portion of the basin (Rogers 1965), though it is not known whether it affects groundwater movement.

Recharge Areas
Recharge of this basin is likely from percolation of precipitation and runoff, and subsurface flow from San Jacinto Mountains.

Groundwater Level Trends
Water levels reported for wells drilled in the late 1980s and early 1990s ranged to 100 feet below ground level.

Groundwater Storage
Groundwater Storage Capacity. No information is available.

Groundwater in Storage. No information is available.

Groundwater Budget (Type C)
No information is available.

Groundwater Quality
Characterization. Water sampled from 5 public supply wells show an average TDS content of 306 mg/L with a range of 140 to 410 mg/L.

Impairments. Groundwater from some parts of the basin is high in TDS and nitrate content (DWR 1975).

1 A description of each member in the constituent groups and a generalized discussion of the relevance of these groups are included in California’s Groundwater – Bulletin 118 by DWR (2003).
2 Represents distinct number of wells sampled as required under DHS Title 22 program from 1994 through 2000.
3 Each well reported with a concentration above an MCL was confirmed with a second detection above an MCL. This information is intended as an indicator of the types of activities that cause contamination in a given basin. It represents the water quality at the sample location. It does not indicate the water quality delivered to the consumer. More detailed drinking water quality information can be obtained from the local water purveyor and its annual Consumer Confidence Report.
